UV Printing Inks for Glass Bottles

Quest Industries is always in search of new technology for container decoration. As a result, Quest customers benefit from having latest technical approaches available to decorate their containers. The most important aspect of any new technology is that customer must benefit from it.

For the past three years, Quest has been working on using UV inks for higher speed screen printing on glass bottles. One of the key advantages of the UV inks is; availability of sharper bright colors like Red, Orange, Yellow, Blue, Green etc. without heavy metals. Heavy metals are prohibited in California and other states pursuant to California Proposition 65 and Conference of North Eastern Governors (CONEG).

Application of UV inks for high speed screen printing requires unique understanding of surface preparation before the ink is applied and proper curing to achieve durability. Currently, Quest is using high speed UV screen printing ink technology to decorate Spirit glass bottles, Beverage glass bottles and Personal Care glass bottles. Bottles presented in this newsletter were printed using UV Inks.
